Wheel Straightening

Buckled wheels

If your wheel(s) is buckled and requires straightening due to damage (from for example pot holes, impacts while driving) we will assess the wheel and advise you if we believe the wheel can be straightened, but until we actually complete the process we will not know if this is achievable. During the straightening process there is a risk that the wheel may get damaged or crack, there may already be a hair line fault that is not visible during inspection or the heating can cause a new crack. This cannot be anticipated and we accept no liability for this. At this point the wheel will need replacing and the replacement will be your responsibility and at your cost.

Our aim is to reduce the buckle(s) in the wheel; we will not be able to make the wheel perfectly round again so there may still be some vibration but much reduced.

In addition, please be aware that during the straightening process the paint /powder coating / wheel can get damaged and we will not be responsible for this. We will of course make every effort to reduce paint damage to a minimum where possible but you may need to have the wheel refurbished and at your cost.

We do not guarantee the wheel once straightened.

If you have any questions, please ask.
